Submitted (12-ARR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetracoon nigroviridis
genome. For more information, please take a look at
http://www.genoscope.cns.fr/Tetracoon.

Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT47757), chicken CHD-W W refers to the W chromosome) gene (see also AAT42758) and the great tit CHD-W gene (see also AAT42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT47751) and CHD-W (see also AAT42754) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT42757), chicken CHD-W (W refers to the W chromosome) gene (AAT42758), and the great tit CHD-W gene (AAT42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.

The chicken CHD-W gene (AAT42754) acting alone or in conjunction with the closely related CHD-1A gene (AAT42751) is suggested to initiate female development in birds. The sequence of CHF-W was deduced from 2 clones isolated from a 10-day chick embryo library using a fragment of the CHD-1A gene as a probe. The CHD-W gene is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 CAGGCTAAGCAGTTACAGACCCGTGCAGATTACCTCATTAAATTACTGAATAAAGACCTT 120
                                                                                   Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (see also and AAT42757), chicken CHD-W (W refers to the W chromosome) gene (see also AAT42758) and the great tit CHD-W gene (see also AAT42759). Translated amino acid sequences of this region are provided in AAW008146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42751) the CHD-W (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of

The sequence of CDH-1A was deduced from 3 clones isolated from a stage 10-12 chicken embryo cDNA library using a great tit CHD-W sequence (see also AAT42755) as probe. The CHD-1A (A - Avian) gene swas close identity to the mouse CHD-1 gene (see also AAT42756-57). It is located on an autosome or Z chromosome. Probes based on CHD-W and CHD-1A give a W chromosome-specific signal on hybridisation to genomic DNA of a non-rarite bird and can be used for sex determin. Of a bird. CHD-1A nucleic acids can also be used to control the sex of the progeny of a bird.

A-TRF, optionally expressed by gene therapy, is used to inhibit shortening of telomeres associated with ageing (for cosmetic purposes) and disease, e.g. ataxia telangeictasia, bown syndrome, atrophy of the skin, age-related macular degeneration, atherosclerosis, tumours and viral (including human immune deficiency virus) infection. Cells expressing A-TRF also have an increased life span in vitro, e.g. for expression of recombinant proteins or where intended for subsequent transplant or for testing, eliminating the need for transformation.
                                                                                                                                                                                                                                                                                                                                                                                   telomere; ageing; ataxia telangeictasia; Down's syndrome; tumour; viral.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colliss or ulcerative collis. The present sequence is a cDNA encoding a digestive system antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; colorectal cancer; colorectal cancer antigen; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  131 aaaaagcctcaggggaagcagctacagacccgagcggattacttgttgaagctgctcaga 190

                                                                                                                                                                             The present invention provides the protein and coding sequences of a number of colorectal cancer antiques. These are shown in had AAIS7547-AAI57619 and AAAIS869-AAAI8641. These can be used in the diagnosis, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antigen coding sequence of the invention.

Note: The sequence data for this patent did not form part of the printed aspecification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

(ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              from promyelocyte line HL60 clone pWT21:PL85. The ligand comprises residues 1.402, 1.310 (Sol.), 42.402 (mature) or 42-310 (sol.), mature) or sequence ARK53965. An allelic variant (AAQ63954, AAK53966) was derived from human placenta. Co-transfection of a mammalian host cell with DNA encoding residues 42-310, plus DNA encoding alpha-1,4-fucosyltransferase and DNA encoding alpha-1,4-fucosyltransferase and DNA encoding form of a paired basic amino acid converting enzyme (RACESOL), encoded by sequence AAQ63957, allowed production of sol. mature

The present sequence encodes a human glycoprotein having P-selectin daving Pessent sequence encodes a human glycoprotein having PSL activity. The present invention describes a glycoprotein having PSL activity which comprises a carbohydrate and a protein. The protein includes amino acids 4.2 60 of AAW72695, but lacks the intracellular domain and optionally the transmembrane domain of mature PSL protein may be useful in treating conditions characterised by P- or PSL protein may be useful in treating conditions characterised by P- or CE E-selectin mediated intercellular adhesion. Such conditions include myocardial infarction, bacterial or vital infection, metastatic monitable sclerosis, disease, glomerulonephritis, glingivitis, conditions, inflammatory disorders, asthma, emphysema, thermal injury, multiple sclerosis, disease, glomerulonephritis, glingivitis, conditions, include sclerosis, disease, glomerulonephritis, glingivitis, conditions, include and create and cytokine-induced toxicity. The periodoritis, hamolytic uremic syndrome, uccardial injury, disease, necrotising enterocolitis, and cytokine-induced toxicity. The isolated PSL protein may be useful in organ transplant crejection. The isolated PSL may be used to treat hamodialysis and leukophoresis patients. Additionally, isolated PSL protein may be used itself as an antimerastatic agent. The isolated PSL may be used to treat hamodialysis and inhibitor of P- or E-selectin-mediated intercellular adhesion.
                                                                                                                                                                                                                                                                                                        Human; glycoprotein; P-selectin ligand protein; inflammatory disease; intracellular domain; E-selectin-mediated intercellular adhesion; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Soluble P-selectin ligand glycoprotein - with truncated protein sequence lacking intracellular domain
       Human glycoprotein P-selectin ligand protein encoding cDNA.

The DNA is present in polymorphonuclear leukcoytes and monocytes. The isolated DNA can be used to produce recombinant P-selectin ligand in mammalian host cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       525 accagcagcacaggaagcacaggaccactcaacccacaggcctggaggcacaggaccactgc 584

The present sequence encodes a P-selectin ligand protein. The P-selectin ligand is a glycoprotein. The protein binds in a calcium-dependent manner to P-selectin which is present on the surface of cells. The p-selectin ligand can be used to treat a wide variety of conditions characterised by intercellular adhesion involving P-, E- or L-selectins, e.g. myocardial infarction, infections, metastasss, inflammation, Crohn's disease, and to prevent transplant rejection. It can also be used to raise specific antibody (useful therapeutically as inhibitors of adhesion or for immunodiagnosis of inflammation and cancer) or to screen for selective inhibitors. Fusion proteins of the P-selectin ligand protein are used to treat conditions related to selectin expression, e.g. fusion with interleukin-11 to treat bone marrow morphogenic protein (BMP) to stimulate bone or cartilage formation, or other cytokines to sites of inflammation.

was oligo dT primed from 5ug of poly A+ RNA from egg.
ECORI-NotI cut cDNA was then ligated into pCS107 with
ECORI at the 5' end and NotI at the 3' end*
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       house mouse.

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKE2): Email s. Wiemann@dkfz- heidelberg.de;
sequenced by GBF (National Research Centre for Biotechnology Ltd.,
Braunschweig/Germany) within the cDNA sequencing consortium of the
German Genome Project.
No s1 sequence available.
                                                                                                                                                                                                                          Bloecker, H., Boecher, M., Brandt, P., Mewes, W., Weil, B. and Wiemann

Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT4757), chicken CHD-W (W refers to the W chromosome) gene (AAT42759), and the great tit CHD-W gene (AAT42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT42757), chicken CHD-W (W refers to the W chronosome) gene (AAT42758), and the great tit CHD-W gene (AAT42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT4774-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.
                                                                                                                                                                                                                                                                                                                                                                                                                                             1 ATTTTACCTGATGACCCAGATAAGAAACCACAGGCAAAGCAGTTGCAGACCAAGAAACCA

Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (see also and AAT42757), chicken CHD-1W (W refers to the W chromosome) gene (see also AAT42758) and the great tit CHD-W gene (see also AAT42759). Translated amino acid sequences of this region are provided in AAMW014649. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754) checken also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                          Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT42757), chicken CHD-W (W refers to the W chromosome) gene (see also AAT42758) and the great tit CHD-W gene (see also AAM42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-IA (see also AAT42754) and CHD-W (see also AAT42754) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.

the closely related CHD-1A gene (AAT42751) is suggested to initiate female development in birds. The sequence of CDH-1A was deduced from a stage 10.12 chicken embryo cDNA is a clones isolated from a stage 10.12 chicken embryo cDNA ibrary using a great tit CHD-W sequence (see also AAT42755) as The CHD-1A (A = Avian) gene shows close identity to the mouse CHD-1 gene (see also AAT42756-57). It is located on an autosome or Z chromosome. Probes based on CHD-W and CHD-1A give a W chromosome-specific signal on hybridisation to genomic DNA of a non-rarite bird and can be used for sex determin. of a bird. CHD-1A nucleic

A-TRF, optionally expressed by gene therapy, is used to inhibit shortening of telomeres associated with ageing (for cosmetic purposes) and disease, e.g. attaxia telangeictasia, Down's syndrome, attrophy of the skin, age-related macular degeneration, atherosclerosis, tumours and viral (including human immune deficiency virus) infection. Cells expression of recombinant proteins or where intended for subsequent transplant or for testing, eliminating the need for transformation.
                                                                                                                                                                                                                                                                                                                                                             telomere; ageing; ataxia telangeictasia; Down's syndrome; tumour; viral.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLIG151), expressed DNA sequences (ABLIG176-ABLIG151), expressed DNA (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed appending the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Drosophila melanogaster expressed polynucleotide SEQ ID NO 13811.
                                                                                                                                                                      Drosophila; developmental biology; cell signalling; insecticide;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention disciloses genomic DNA sequences (ABL01817, expressed DNA sequences (ABL01804 DAL16175) and the encoded proteins (ABB7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                          The present invention provides the protein and coding sequences of a mumber of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a cDNA encoding a digestive system antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; colorectal cancer; colorectal cancer antigen; gene therapy; ss.

acid detection reagent for detecting 1000 or more a and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 34750;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T; 0 other;

The polypeptide, nucleic acid encoding it and an antibody raised against it are applicable in dencoding it and treatment of cancer, hamenopathy, HIV (human immunodeficiency virus) infection, immunological diseases, various inflammations including, carcinoma of the prostate and benign tumour of the prostate, diseases due to metabolic defect of folic acid, neuropsychosis and developmental disturbance. The present sequence encodes the prostate-specific membrane antibody protein 12.

The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82700 and ABG8188 to AAG68193 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 CAGGCAAAGCAGTTGCAGACCCGTGCAGATTACCTCATTAAATTACTGAATAAAGACCTT 120

The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
